Both my daughter and I thoroughly enjoyed this book. We've been looking for STEM books on engineering; but, with this book centering on a story of true events, this was an added bonus that you don't find very often.

It's not just about technology. Thrown in is the unexpected surprise of company politics and relationships that can be expected when working on company projects. The female character demonstrates the hardships as well as the personal satisfaction of traveling to another country to problem-solve her company's technology in China.

This book, in a most interesting way, opened my daughter's eyes to tackling big issues in a simple way. This approach makes sense and will be useful for her.

We highly recommend this book for any teenager or college-aged person who is considering going into engineering.

Very well written.
